

ASN3 Anonymous Social Network phase 3

Shanky Balani
Brian Burns
Jonathan Grimes
Ben Kornfuehrer
Sang Yun

CS 373: Software Engineering, Fall 2010

Outline

- Demo
 - Browser
 - User
 - Admin
- Issue Tracker
 - Bugs Fixed
 - Outstanding Issues / Future Improvements
- Why it's the best
- What we learned

Browser Demo

- sort data
- search/filter data
- paging
- accordion
- signup

User Demo

- login
- view your data
- rate a class
- edit a rating
- delete a rating
- note updated aggregate scores after each operation
- change password
- logout

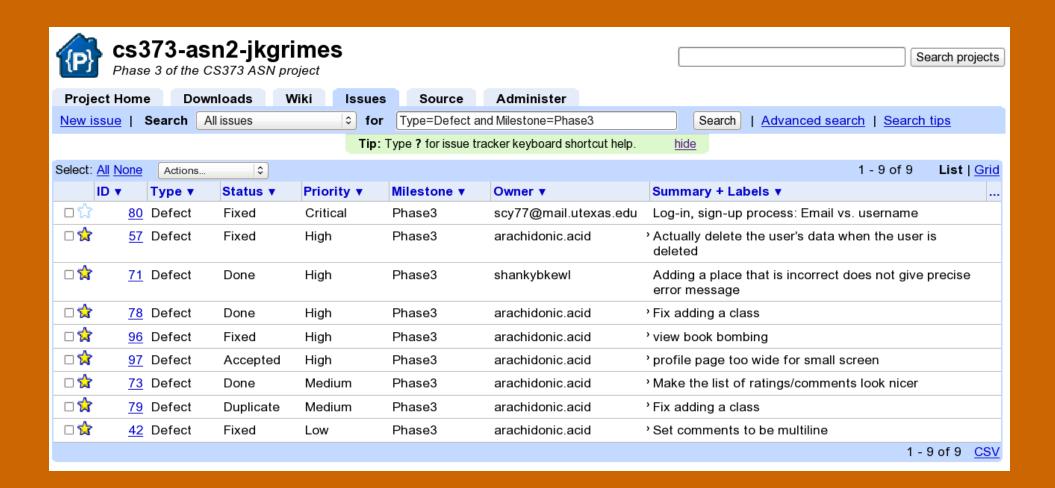

Admin Demo

- login as admin
- edit a class
- delete a class
- show list of students
- delete a student
- run tests
- import data
- export data
- clear data
- console

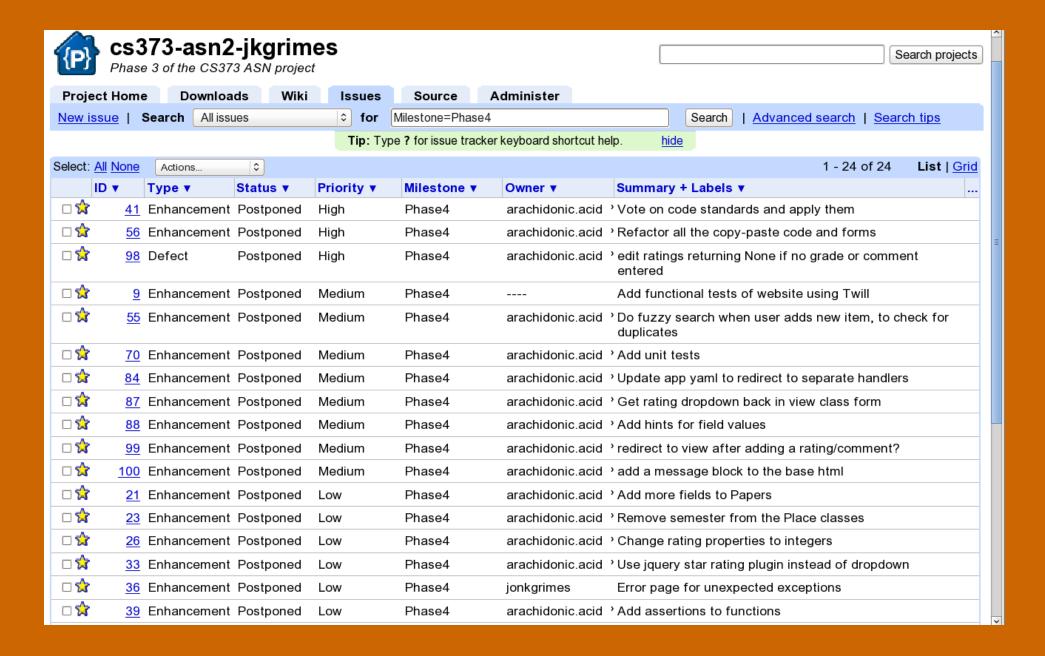

Issue Tracker

- major bugs fixed
- outstanding issues
- future improvements (phase 4)

Issue Tracker: Bugs Fixed

Issue Tracker: Phase 4

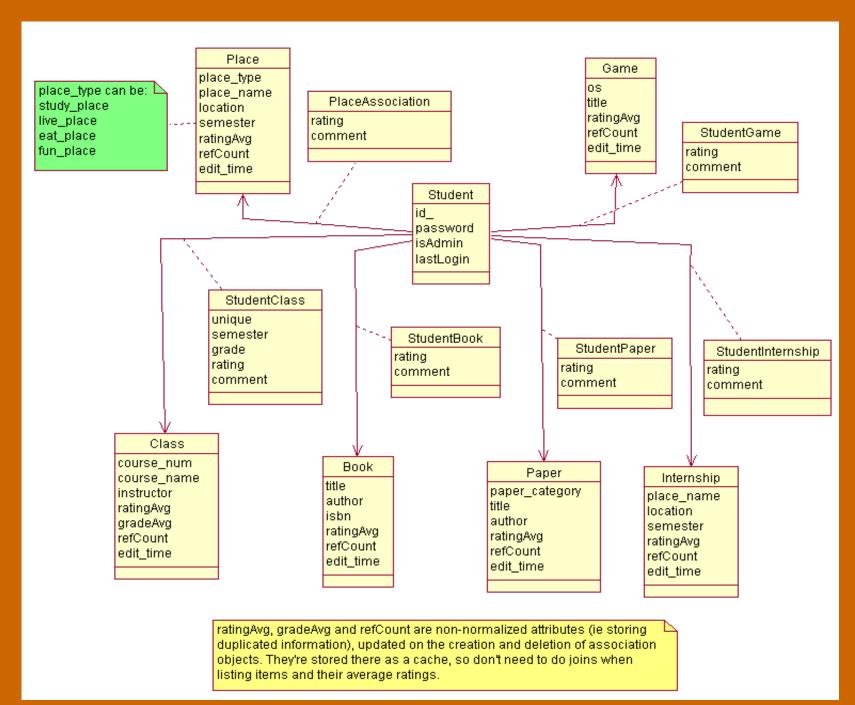

Why ours is the best

- speed implies scalability
- DataTables plugin filter, search, sort, paging
- aggregation done at time of input for speed
- lets you rate existing items
- averages over course+instructor, not unique #
- import does semi-fuzzy search for existing items

What we learned

- jQuery is awesome
- using decorators for authentication
- copy-pasting code is bad better to do the abstraction up front.
- Twill for website testing
- who needs relational databases?
- making websites is not so bad
- do site design up front, with wireframes, etc
- finally figured out how to use Git
- Rails is nicer than AppEngine
- don't need to be tied to AppEngine can abstract all the data and ui aspects, host same app on Amazon, or use Rails, (see AppScale and Active Cloud DB projects)

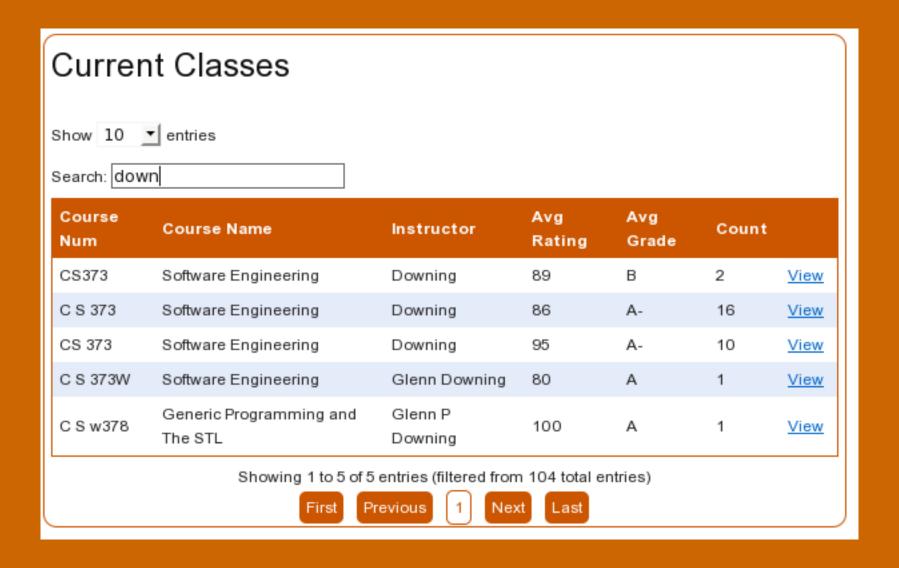

UML

Aggregation

```
class StudentBook(db.Model):
  student = db.ReferenceProperty(Student)
  book = db.ReferenceProperty(Book)
  rating = db.StringProperty(validator=validate_rating)
  comment = db.TextProperty()
  def put(self):
    db.Model.put(self) # call superclass
     self.getAvg() # update averages
  def getAvg(self):
    book = self.book
    links = book.studentbook set
    ratings = [int(link.rating) for link in links]
    n = len(ratings)
    ratingAvg = None if n==0 else sum(ratings) / n
     book.ratingAvg = ratingAvg
     book.refCount = n
     book.put()
```

DataTables plugin

DataTables plugin

```
{% extends "../ base.html" %}
{% block scripts %}
<script src="/static/jquery.dataTables.js" type="text/javascript"></script>
{% endblock %}
{% block content %}
<h2>Current Books</h2>
<thead>
 Title
 Author
 ISBN
 Avg Rating
 </thead>
 {% for book in books %}
 {{ book.title }}
  {{ book.author }}
  {{ book.isbn }}
  {{ book.ratingAvg }}
 {% endfor %}
<script type="text/javascript">
$(function() {
$("#data").dataTable({ "sPaginationType" : "full numbers"});
});
</script>
{% endblock %}
```

Authentication decorators

```
def authenticate(f):
  def check_session(self):
    session = Session()
    if 'student_id' not in session:
       return doRender(self,'not auth.html')
    else:
       return f(self)
  return check session
class AddBook(webapp.RequestHandler):
  def get(self):
    form = BookForm()
    doRender(self,'book/add.html',{'form':form})
  @authenticate
  def post(self):
    form = BookForm(self.request.POST)
    if form.is_valid(): # checks values with validation functions
       book = form.save()
       self.redirect("/book/view?id=%d" % book.key().id())
    else:
       doRender(self,'book/add.html',{'form':form, \
          'error': 'ERROR: Please correct the following errors and try again.'})
```

Twill

a simple twill test script

check home page go localhost:8080 code 200 find "@nonymous Social Network"

look at list of books follow Books code 200 find "Current Books"

try to login and fail follow Login fv 1 1 brian000 fv 1 2 wrongpw submit code 200 find "Invalid"

Twill ctd

```
# add a book
follow Books
follow Add
# >> showforms
# Form #1
                                  Type____ID__
# ## ## ___Name____
                                                        Value
#1 title
                text id title
#2 author
                    text id_author
#3 isbn
                  text id isbn
# 4 _id
                  hidden (None)
#5 1 None
                    submit (None) Add Book
fv 1 1 "Twill: The Book"
fv 1 2 "Anonymous"
fv 1 3 "123456789"
submit
code 200
```

Twill ctd

> twill-sh -q test/twill

[runs all the test scripts in the specified folder, alerts you to any errors found]
